Mgrey font

Informations

Author: Anthony Phan
Last version: November 9, 2000

This very small and simple font is made of 8 kinds of characters : blank square, black square and six grey squares. Each kind comes in 15 sizes (15 is the upper limit of the number of different heights in tfm files). Grey fonts are naturally resolution dependent. Setting resolution independent dimensions as it is natural for common TEX documents leads to non-perfect results. But that's our choice. This font is intended to be used to draw pixelized samples as one can see in some computer science articles or books. In this file, you'll find an example of TEX macro to draw such things. Just have fun with it!
